Strategic Outsourcing

Strategic Sourcing is the dynamic delivery of external business and information technology resources and services to ensure achievement of business objectives.

E-Partners LLC offers contracting services for many venues of information technology staffing needs. Whether it's new development, ongoing maintenance and support, or conversion of legacy systems; E-Partners LLC has the resources you need. This allows your company the flexibility of having the right resource at the right time to complete that high priority project. Don't let your company lose competitive advantage because of a staffing issue. We have highly trained professionals specializing in the following technology areas:

E-Partners Alliances - Rhythmyx

Percussion's award winning easy-to-use web content management system is based totally on open standards (XML, XSL and JAVA). Content can originate from any sources, including automated content feeds, and can be published to any number of sites and output formats, including both files and application servers. Rhythmyx manages content at the item level to allow reuse and re-purposing. The dynamic workflow engine accommodates rapidly changing review processes with no coding required. Rhythmyx is more than a solution for today; it's a product you configure for tomorrow.

Creation & Update
This may sound redundant, but the goal of this step is to get content into the system. If the content has already been created, it can be loaded into Rhythmyx. If the content has not been created, contributors can use a template to create content. In both cases, contributors describe the content by associating metadata in order to properly target the content to specific audiences. Once submitted, the content enters an approval process. As the content is being approved the contributor can track the progress.

Review & Approval
In this stage, the editors receive notification that the content is ready for their approval. As the editors review the content, they can add related content to make the information more meaningful for end users. For example, if the content is a book review, other books from the same author might be associated with this book.

Format & Assembly
Keeping the content separate from the format, allows you to reuse and re-purposing the content for many uses. By associating the content with the format after applying the metadata, the same content can be formatted in multiple ways to allow for the different delivery mechanisms.

Publish
Publishing content allows for it to be given to the delivery mechanism for access by your customers, partners, employees and suppliers. Although this appears to be the final step, this is a circular process that allows your content contributors to make continuous improvements and updates to your content.

E-Partners Alliances - Mozquito Matrix Server

The Complete Solution for Intelligent Web Applications

Benefits:

- XML-based
- strictly adheres to W3C standards
- 20 new XHTML-FML tags
- dynamic page generation
- no client-side plug-ins needed
- cross-browser compatible
- works with all scripting languages
- probe technology to evaluate browser capabilities
- HTML data compression

With the Mozquito Matrix Server, the new functionality of XHTML-FML can be combined with your server's current capabilities, such as database access. Now you can display dynamically generated, intelligent Web applications that are non-proprietary (no client-side plug-ins needed), cross-browser compatible as well as meet W3C standards. Client-side input validation and in-form calculation help decrease server load. Transferable HTML data can be compressed up to 80 %, helping to decrease bandwidth use. **Get the most out of your server.**

Design a new generation of Web user interfaces.
The 20 new XHTML-FML tags help you turn your Web pages into Web applications with little more than the click of a mouse button. The Forms Markup Language (FML) is the world's first extension of XHTML. The Mozquito Factory 1.5, included in this package, is an XML-based authoring environment. Now, with the Mozquito Matrix Server, you can use the new XHTML-FML together with all current scripting languages, such as ASP, CFM, PHP, JSP, and any yet to come.
Form the Web with Mozquito Technologies.

Increase customer satisfaction by building a better Web site.
Combine the dynamic generation of Web pages with the intelligent power of XHTML-FML. This new generation of Web applications adapt to the user's needs depending on user input, even when working off-line. You can create Wizards with context sensitive help to guide the end-user through complex Web user interfaces. Data can be transferred through secure lines, increasing customer confidence.
The Web has no limitations... except your imagination
